Punit Mundra

BackEnd Developer

Summary

- 14 Years of Experience in Software Development. Working as a back-end engineer at Progress (Chef). I had an experience in building the product as a SaaS (software as a service).
- Design and implementation of RESTful web services. Managing the AWS resources.

Key skills

- Proficiency in Back-end & Technology stack: Go-Lang
- Message broker: beanstalkd, RabbitMQ and NATs
- Area of Interest is Operating System, Data Structure, Analysis and Design of an Algorithm and Object Oriented Programming
- Habitat, Docker and Linux Raw Containers

Programming

- Golang**, C++, C, CoreJava.
- Scripting**: Shell scripting, Python, JavaScript
- Database**: PostgreSQL, OpenSearch, MySQL, Redis
- Cloud**: AWS, Terraform, Chef

Publications

- Modelling and Verification of Kerberos Protocol using Symbolic Model Verifier.
- Enhanced mining association rule algorithm with reduced time & space complexity, 2011.
- Modelling & Verification Of Inter Realm Authentication in Kerberos Using Symbolic Model.

Experiences

Progress Software

Finnovation Pvt Ltd

Exotel

Mitel Network

Samsung R&D

Ixia Technologies

Working as a **EM**, Dec-20 - at present.

Worked as a **Team Lead**, Aug 2019- Nov 2020.

Software Engineer-II, Nov 2018 - July 2019

Senior M Tech. Staff-I, May 2016 - Nov 2018

Software Engineer-II, Jan 2014 - May 2016

Software Engineer-I, July 2011 - Dec 2013

Projects

Platform 360

Platform 360 is a multi-tenant SaaS platform built on a microservices architecture, supporting key Chef products at scale. The platform delivers essential capabilities such as user and tenant management, authorization, and notifications, enabling secure onboarding and management of enterprise customers.

Technologies: Golang, postgres-sql, open-search

Roles: Design, Code Review, Collaboration with Product. Designed and implemented containerized services deployed via the Replicated engine, ensuring scalability, reliability, and operational consistency across customer environments.

Automate HA

Automate HA is a high-availability architecture for Chef Automate, an enterprise platform that delivers centralized visibility into infrastructure, application, and security automation with full auditability.

The project involved designing and implementing HA-ready backend services, supporting multi-node deployments in both on-premises and cloud environments, including air-gapped setups. Key contributions included developing CLI-driven workflows for pre-flight validation, firewall rule verification, and deployment consistency checks to prevent misconfigurations prior to installation and upgrades.

Technologies: Golang, PostgreSQL, OpenSearch, Terraform, Shell Scripting.

Roles: The role also included hands-on troubleshooting of distributed systems, supporting customers through install, upgrade, and recovery scenarios, and diagnosing complex HA-related issues in production environments.

Video KYC Service

V-KYC service is used to know your customer over the video call. It is P2P call from Mobile app to the browser. V-KYC service built as a SAAS product for other enterprise customers as well.

Roles: Design and Implementation of video-kyc services with **AWS WebRTC SDK**. The Service deployed over an AWS platform as lambda service. Define the data model and API endpoint, used Redis cache to avoid look up latency. Used gRPC to communicate with other micro service.

Integration of IP calling SDK

Created a wrapper sdk by customize the existing sdk based on the customer requirement.

Roles: Implementation of Rest End point. Used FCM (Fire-base Cloud Messaging) to send the push notification to the android devices.

Education

M.Tech in Software Engineering

MIT, Manipal 7.9 CGPA, 2010-2012

GATE Qualified

AIR 1900, Percentile 98.2, 2010

B.Tech in Computer Science

LNCT, Indore 71.2%, 2004-2008

High Secondary

at **Digamber Public School 64.8**, Indore, 2003

Secondary School

at **Digamber Public School 71.2**, Indore, 2001
